Fast data fusion and its role in developing climate quality sea surface temperature data sets from multiple sources.

**Julian Hill, Martin Juckes and
Paul Fieguth**

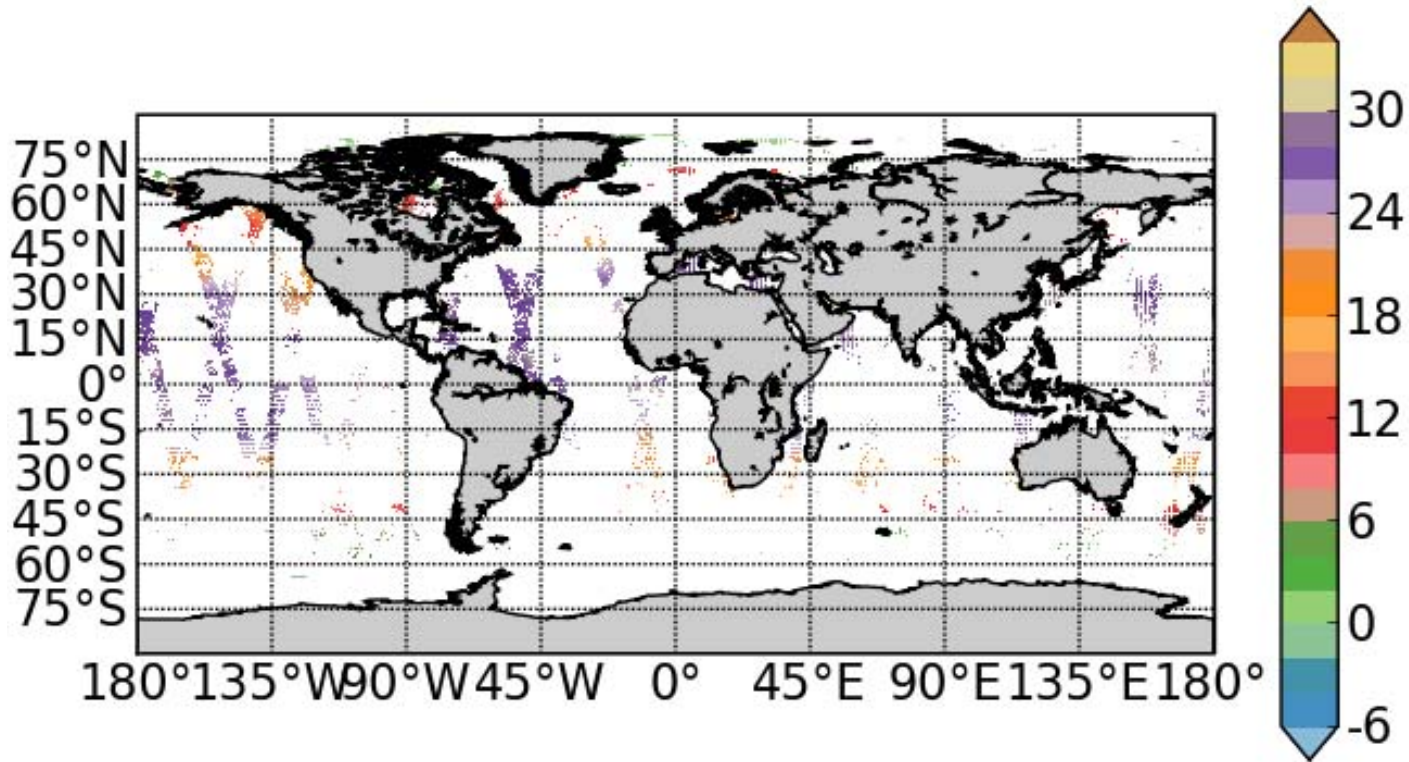

Introduction

- Brief introduction to climate change and SST
- Analysis method
 - why?
 - how?
- Data and Uncertainties
- Conclusions/Further work

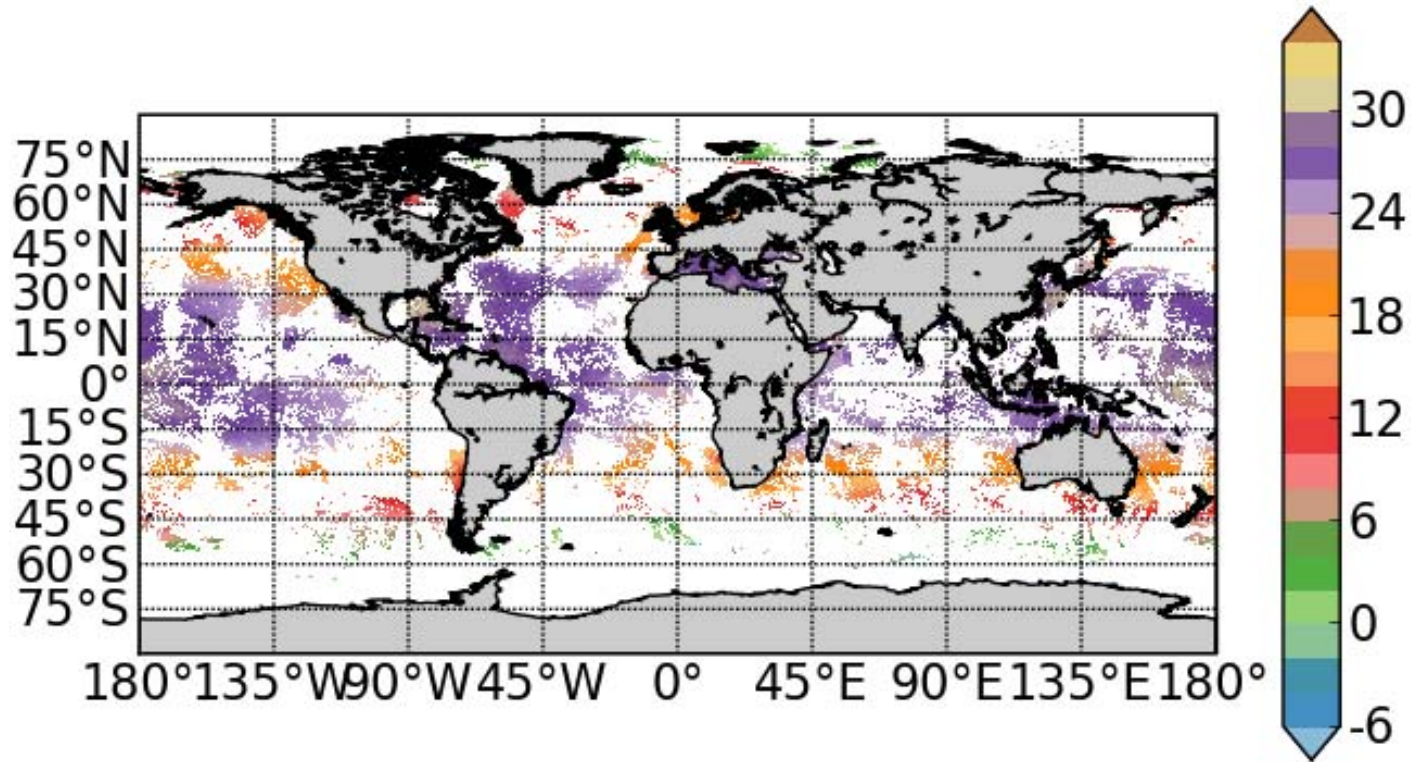

Why is SST important

- Forcing field for atmosphere (or ocean) only models.
- Weather forecasting parameter
- Main stay of Climate Record
 - 1850 onwards
- Can be measured by satellite
 - Long term high resolution data of recent era possible.

Sample satellite data - AATSR

Sample satellite data - AVHRR

Why fill in the gaps?

- Calculate regional averages
 - Trends in climate change.
 - Monitoring
 - Global and local
- Model forcing fields
 - Complete fields required
 - Higher resolution required.

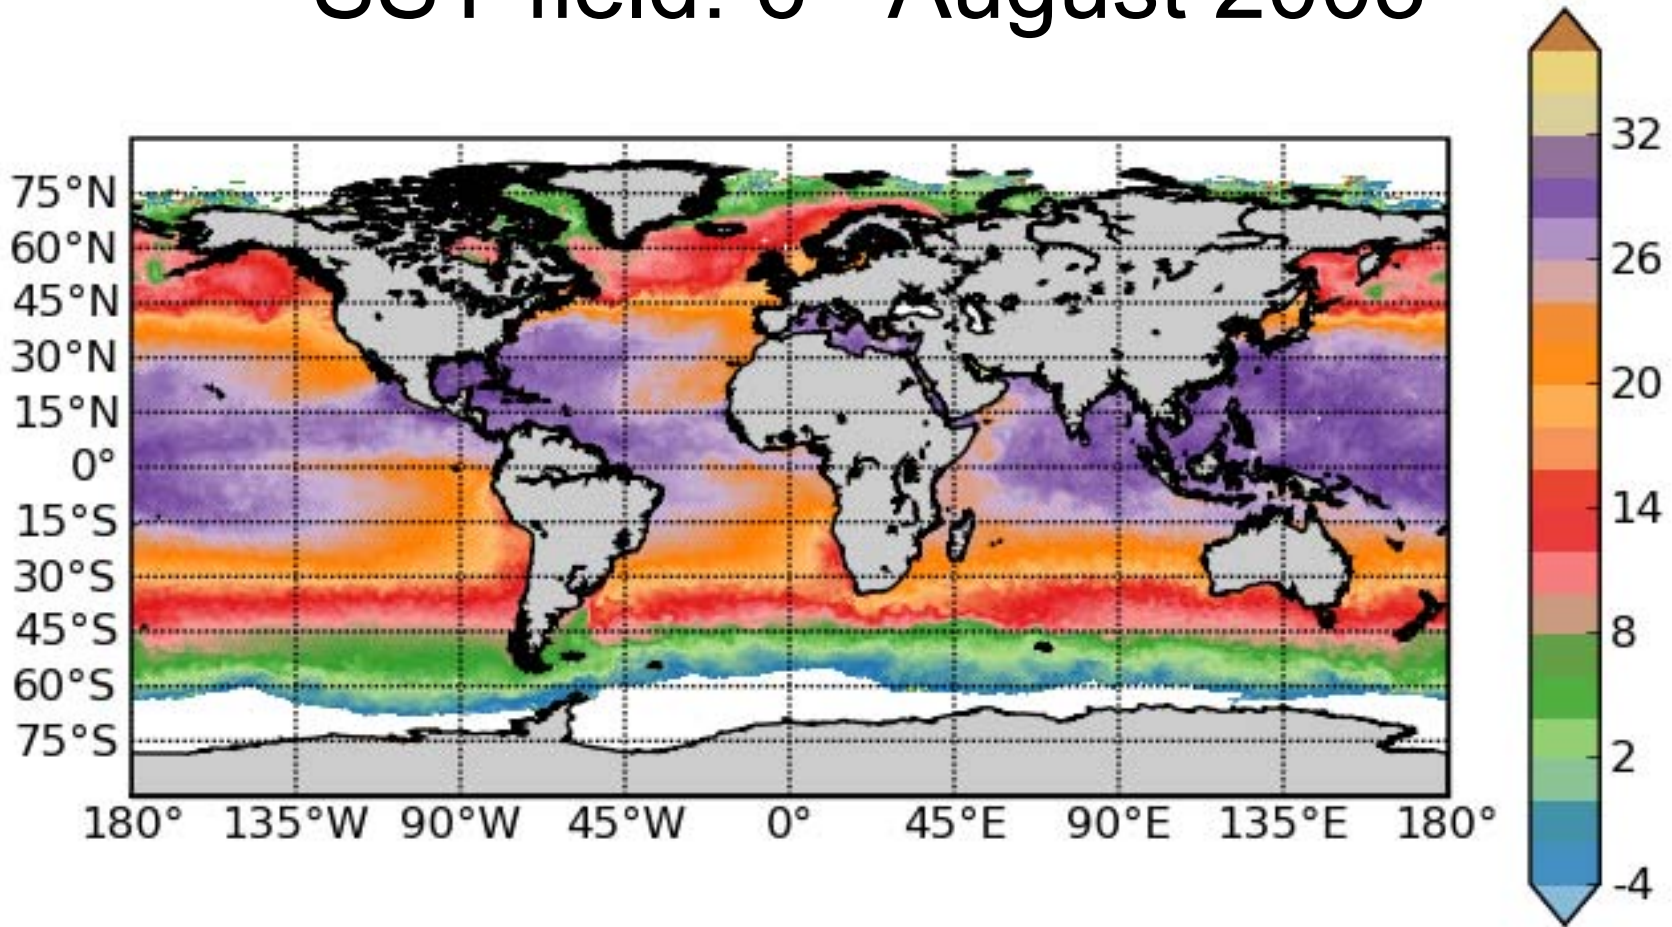

How do we fill in the gaps?

- Kalman Filter
 - Forward time direction
 - Forecast step is past time step as well as a time model.
 - Reverse time direction
 - Forecast step is future time step with a time model
 - Smoother
 - Forecast is both past and future time steps.

Kalman Filter Estimators

SST field: 6th August 2003

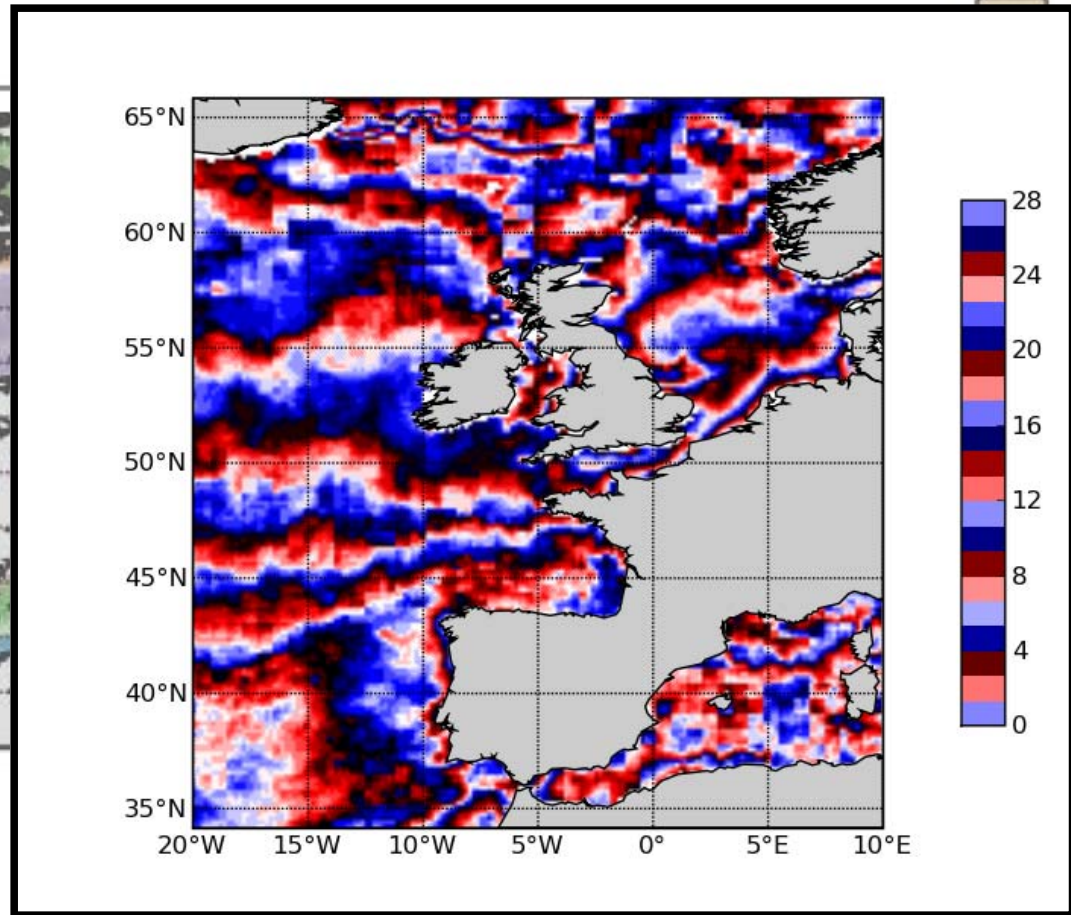

Sea Surface Temperature (SST): Near surface

sea water temperature

IET Target 08: 16/04/08

SST field: 6th August 2003

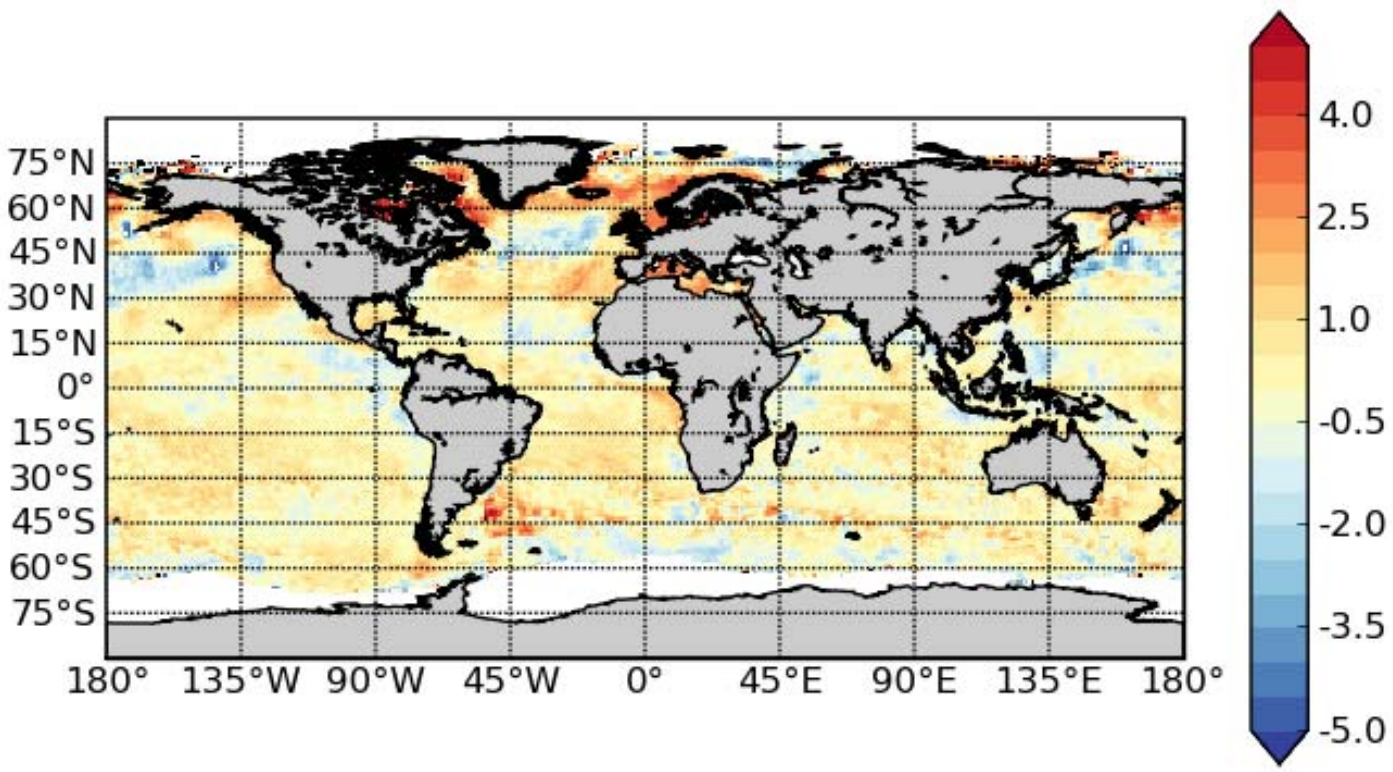

Sea Surface Temperature (SST): Near surface

sea water temperature

IET Target 08: 16/04/08

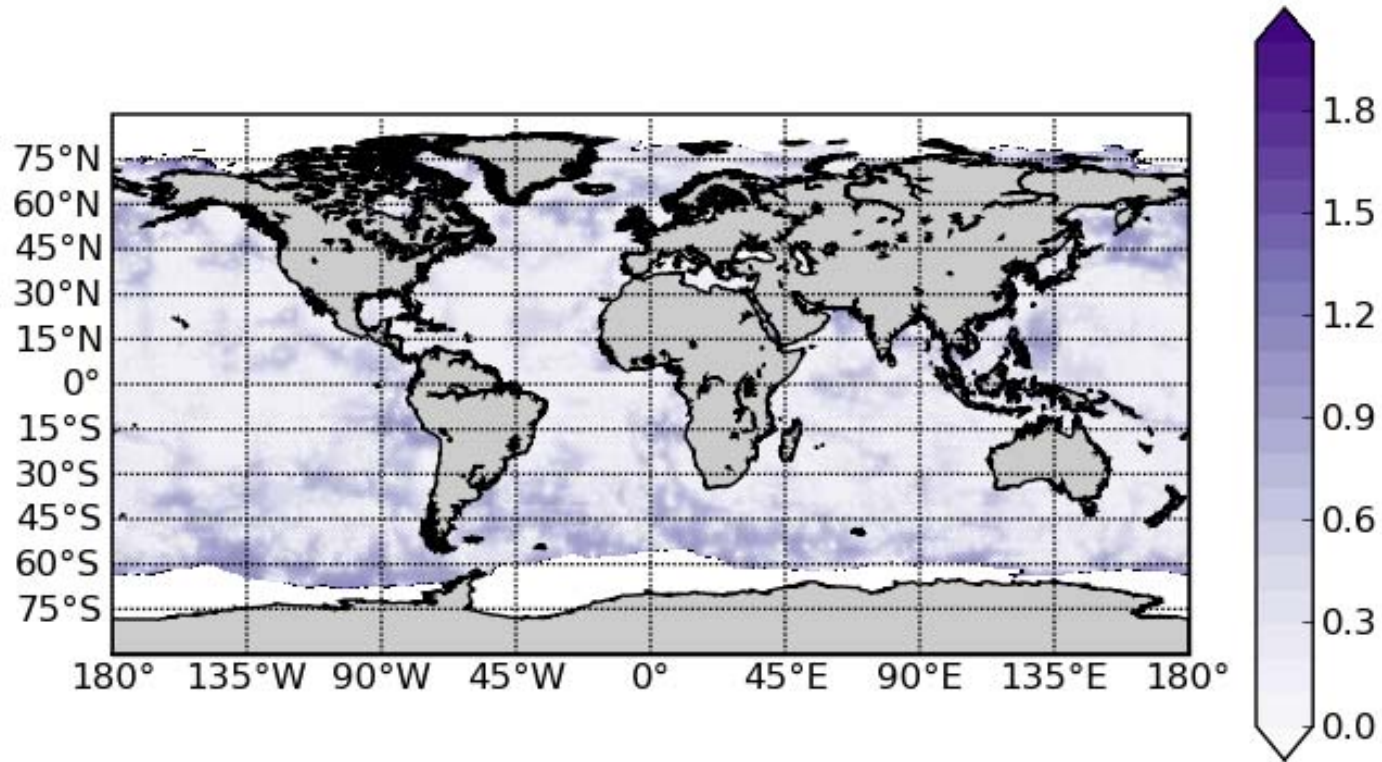

Anomaly Map

Anomaly series

Example SSTFusion uncertainty

How do we quantify method uncertainty?

- Observations.
 - Uncertain, biased
- Uncertainty in the filter
 - Calculated, but assumes model is true and uncertainties on obs. known
- Uncertainty in the model
 - Need to use ensembling methods to estimate this

Conclusions

- Best estimate signal of consistent with *in situ*
- Robust uncertainty estimates required.
- Ensembles of analyses.
 - Parallelize analysis method.
 - Parameter space means large ensemble.
 - Data volumes are huge.
